Kali Linux Terminal Commands + Bash Scripting --- Technical Guide

Content

1. Types of Linux (*** on 2 pages ***)
  1.1 Filesystem of Kali Linux

2. What is Linux terminal? (*** on 26 pages ***)
  2.1 How to access Linux terminal?
  2.2 Keyboard shortcuts for easier work in Linux terminal
  2.3 Basic commands in Linux terminal
    2.3.1 Create directory
    2.3.2 Use of text editors inside Linux terminal
    2.3.3 Display of text file content in Linux terminal
    2.3.4 Add additional text phrases inside existing 'text document' using Linux terminal
    2.3.5 Command 'man'
    2.3.6 Find binary executable files from Linux terminal
    2.3.7 Move file from one to another directory
    2.3.8 Copy file from one to another location
    2.3.9 Remove file or directory
    2.3.10 Change file permissions
    2.3.11 Set time in Linux terminal
    2.3.12 Set time zone in Linux terminal
    2.3.13 Set date in Linux terminal
    2.3.14 Filtering output text using 'grep' command
  2.4 Bash scripts
    2.4.1 Browsing inside long text file.
    2.4.2 Show first 10 (or exactly defined) lines in a file
    2.4.3 Show last 10 (or exactly defined) lines in a file
    2.4.4 Numbering the lines of text file
    2.4.5 Specific use of 'grep' command
    2.4.6 Find and replace option with 'sed' command
    2.4.7 Doing action and copying inside two or more files
    2.4.8 Installing/Upgrade/Removing/ Linux packages

3. Linux terminal advanced commands (*** on 51 pages ***)
  3.1 'aspell' command
  3.2 'awk' command
  3.3 'bzip2' command
  3.4 'echo' command
  3.5 'uname' command
  3.6 uptime command
  3.7 'sort' command
  3.8 'free' command
  3.9 'history' command
  3.10 'cksum' command
  3.11 How to schedule timely execution of command in Linux terminal
  3.12 Scheduling Bash script
    3.12.1 Examples how to schedule a job with srontab
  3.13 Copy hard drives
  3.14 Rescuing data from corrupted hard drive
  3.15 Identify hardware errors and warnings
  3.16 Check all directories size at your present position
  3.17 Expressions in Linux terminal

3.18 Automatically fix problems with file system errors
3.19 Identify or stop processes when using file
3.20 Add group and user to the group
3.21 Joining two files
3.22 User and group IDs
3.23 Encoding of text
3.24 Execute commands even exit your terminal
3.25 Adding or removing package from Linux terminal
3.26 Comparisment of text in two text documents
3.27 Changing small text inside one document and save in other file
3.28 Debugging in Linux terminal
3.29 How to convert or translate characters into the text file
3.30 How to remove repeated lines in files
3.31 System performance monitoring
3.32 Linux permissions when creating file or directory
3.33 How to track real time changes from Linux terminal
3.34 Open any file from Linux terminal
3.35 Command that influence on the previous command

4. Bash Scripts - Practical examples (*** on 40 pages ***)
Example 1 - 15
